Installation Options

INSTALLATION OVER A CONCRETE SLAB

Preparation: Prepare a compact layer of gravel and hard core at least 4 inches deep (loose stone foundation) and cast a layer of concrete with a suitable thickness (usually about 6-8 inches) on top. If water proofing is required, a layer of bitumen membrane can be added, with a polyethylene separator sheathing on top.

Substrate: Create a substrate of 2-4 inches with a rebar mesh about halfway through its depth. Ensure a suitable pitch (about 2%). Comply strictly with curing and stabilisation times.

Installation: Glue the slabs in place, coating both the back of the slab and the substrate. Use a highperformance outdoor adhesive specifically for porcelain stoneware and follow the producer's instructions. Provide expansion joints as required by the specific context.

Joints: Create joints of at least 1/4 inch with the aid of suitable spacers. The joint filler must be a specific product for outdoor use, applied in accordance with the producer's instructions. Clean after installation with a specific cleaner to remove all traces of adhesive and grout.

INSTALLATION ON GRASS AREAS

Preparation: Try out the arrangement of the slabs on the grass to find the best layout. Cut the ground around the edge of each slab with the aid of a spade. Remove the slabs and dig out soil to a depth of about 2.5 inches in the installation position of each one.

Substrate: Add a layer of fine gravel in the hole made for each slab to provide a level, firm substrate. Ensure a suitable pitch (about 2%)

Installation: Put the slabs in place, making sure that the top face is level with or slightly below the surface of the ground.

Joints: If necessary, compact the ground around the edges of the slabs with a rubber hammer.

INSTALLATION ON GRAVEL

Preparation: If laying on soil, dig out to a depth of 4-8 inches; if the paving adjoins grass or any other uncompacted surface, a visible or concealed containing kerb (in stone, metal or PVC) should be used. Level and compact the surface with sand or soil. A geotextile layer will separate the substrate from the soil and prevent the growth of weeds.

Substrate: Lay a level of fine gravel (particle size 12-16 inches) about 4 inches deep (a deeper layer means better drainage). Level with a straightedge and compact thoroughly, with a mechanical compactor if necessary. When installing on gravel over a waterproofed screed, a thinner layer of gravel is sufficient.

Installation: Arrange the slabs in accordance with the chosen layout; if they are installed close together the specific spacers can be used, always leaving a joint of at least 1/4 inch. A white rubber hammer can be used for any adjustments.

Joints: Joints should be filled with a polymer sand filler, specifically for installations of this kind, which is compact but still allows drainage. Otherwise, leave the gaps empty or fill them with washed sand. When slabs are installed with very large gaps, these should be filled with gravel of suitable particle size.

Important Disclaimer: Sizes listed in this catalog are nominal. Online / Catalog printed colors does not always present product color precisely. Final orders shall be placed from current samples received from Mountain Hardscaping or an Authorized Dealer.

Installation Options

INSTALLATION ON SAND

Preparation: Level the zone for paving with the aid of a straightedge.

Substrate: A layer of sand at least 2-4 inches deep is recommended. Ensure a suitable pitch (about 2%)

Installation: Position the slabs with the aid of spacers or a bar so that the joints are perfectly aligned, and level the surface with the aid of a straightedge. A white rubber hammer can be used for any adjustments.

Joints: Fill the gaps between slabs with sand to prevent the risk of tripping..

INSTALLATION ON RAISED PEDESTAL SYSTEMS

Preparation: For assessments on the type of pedestal (fixed, self-levelling) and the height of the top surface, advice from an expert and/or the pedestal supplier is essential. When calculating the number of pedestals and any edge finishing accessories, bear in mind any offcuts and the size of the area for paving in relation to the installation module.

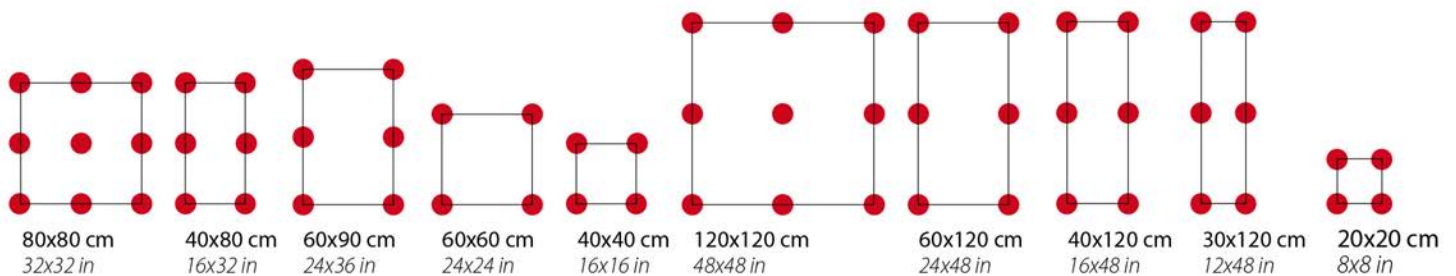

Substrate: The substrate must be appropriately waterproofed and have a suitable pitch (1.5-2%) and systems for water drainage. The surface must have the strength required to support the concentrated load applied by the pedestals.

Installation: Position the pedestals in accordance with the optimal installation grid, taking care to adapt the module to the area for paving and avoid perimeter offcuts of less than 4 inches.

Joints: Pedestals should be arranged with the aid of a spacer which leaves a joint of 1/4 inch between tiles. The open gap created allows rainwater to drain into the cavity underneath.

Caution: risk of breakage. In the event of a heavy item falling on a slab resting on pedestals, the concentrated impact of the object falling from some height could cause it to break, with a potential risk for anyone in the vicinity. The table on page 119 suggests some appropriate precautions, the specific suitability of which must be assessed by a qualified professional in relation to the context and local regulations. Caution: risk of lifting. When outdoor patio coverings and pavings are installed without glue or fasteners, strong winds may lift and move the slabs, with the risk of personal injury or damage to property. Mountain Hardscaping urges customers to check the installation method, specific weather conditions and local regulations with a qualified professional and adopt solutions which avoid all risks.

For a correct installation, for non-vehicular usage, place the pedestals as follows:
